

Intern for a Biotech Startup!

By Star Yu

Bruins for Business Health at UCLA · Jan 27, 2024 · 2 min read

Need work experience? Small biotech companies and startups constantly seek new interns to help with their research endeavors. Working at a startup lets you witness and contribute to the growth of a business from the ground up, offering insights into entrepreneurship, strategy, and business development. Here are a few open opportunities with rolling deadlines to help advance your career.

Sanguine Biosciences

Sanguine Biosciences is pioneering personalized medicine by facilitating patient engagement in biomedical research. The company collaborates with many top pharmaceutical and biotech firms and helps shorten timelines for human trials. With an exceptional workplace culture, Sanguine has received accolades from Fortune and is referenced in studies featured in journals like Nature and Science. Sanguine is currently looking for a UCLA Student Campus Ambassador to assist with marketing, outreach, and recruitment into its Apheresis Program.

A Harvard Medical School stealth spinout

A Harvard Medical School stealth spinout is offering paid internships and full-time roles, including research, business development, computational biology, operations, campus ambassador, and executive assistant positions for undergraduate and graduate students. The company specializes in developing gene therapy delivery modalities for a range of monogenic and common diseases. Their work is supported by prestigious institutions and funds including NIH, Harvard Medical School, MIT, and notable venture capital funds like Bain Capital, General Catalyst, Polaris Partners, Highland Capital, Underscore VC, Pillar VC, and BlueYard Capital.

Ask Mendel AI

Ask Mendel AI plans to use conversational AI to transform biopharma R&D; by letting scientists interact with their data through speech, eliminating the need for coding or SQL queries and making data analysis more accessible. The startup is currently in the pre-funding phase and collaborating with early design partners to roll out a prototype. Those who come on board will get front-line experience of AI's rapidly expanding drug-discovery capabilities and learn about a startup's early phases.

These internships present unique opportunities to gain practical research experience and develop business and entrepreneurial skills. For undergraduates wishing to start their own company, startup experience is perfect for getting a foot in the door.
